SECTION 8 — LIMITATIONS

Proposed False Claims Act Disclosure

Every investigation is constrained by the information available to the investigator, the methods employed, and the resources accessible during the investigative process. This report is no exception. The following limitations should be considered when evaluating the observations and documentation presented herein.

8.1 Scope of Investigation

This investigation was conducted independently without institutional support, governmental authority, subpoena power, or access to classified or restricted information. Accordingly, the report is limited to observations personally documented by the author, publicly available records, and evidence collected during the reporting period.

The investigation was not conducted for the purpose of proving a predetermined conclusion. Rather, it was undertaken to preserve contemporaneous observations and supporting documentation in a manner that would permit later independent review.

8.2 Witnesses

Although I served as the primary investigator and observer throughout this reporting period, I was not the only individual present during many of the events described in this report. Members of my family, including my husband, personally witnessed numerous observations, travel events, and related occurrences documented herein.

Nevertheless, much of the sustained observation effort was conducted by me personally. As a result, many observations rely upon my direct testimony, contemporaneous notes, photographs, videos, and preserved documentation.

Where additional witness statements are provided, they should be evaluated independently according to the witness's personal knowledge and observations.

8.3 Equipment and Documentation

The observations documented in this report were recorded using consumer-grade cameras, publicly available flight-tracking resources, publicly available environmental data, and contemporaneous handwritten and electronic notes.

Consumer equipment has inherent limitations, including image quality, low-light performance, autofocus limitations, recording interruptions, and restricted zoom capability. Accordingly, not every observed event could be documented to the same level of detail.

The absence of photographic or video evidence for every observation should not be interpreted as evidence that no observation occurred. Rather, it reflects the practical limitations of documenting rapidly changing aerial events while simultaneously conducting observations.

8.4 Identification of Aircraft and Objects

Although many aircraft could be identified generally as fixed-wing aircraft, helicopters, or drones, positive identification of every aircraft, drone, or unidentified aerial object was not always possible.

Accordingly, this report generally avoids assigning specific aircraft types, operators, or governmental affiliations unless supported by independent documentation or publicly available records.

Likewise, recurring observations of unidentified objects should not be interpreted as establishing that the same object was observed on multiple occasions unless independent evidence supports that conclusion.

8.5 Correlation and Causation

The chronology documents numerous events occurring during the same reporting period, including aerial observations, environmental conditions, travel, public disclosures, digital events, and other occurrences.

Temporal proximity alone does not establish causation.

Throughout this report, efforts have been made to distinguish between documented observations, recurring patterns, reasonable inferences, and personal hypotheses. In many instances, multiple explanations may exist for the same event.

Where causation cannot be established from the available evidence, no conclusion has been drawn.

8.6 Availability of External Records

This investigation relied extensively upon publicly available records, including environmental data, flight-tracking information, Notices to Air Missions (NOTAMs), satellite imagery, weather observations, and other publicly accessible sources.

The author cannot determine whether additional governmental records, classified information, operational records, radar data, or other non-public information exist that may confirm, explain, or contradict the documented observations.

Similarly, some publicly available records may have changed over time, become unavailable, or reflected the limitations of the systems from which they were obtained.

8.7 Scope of Evidence

This report intentionally limits its evidentiary findings to observations supported by documentation capable of independent review.

Additional personal experiences, subjective impressions, and spiritual beliefs discussed elsewhere by the author have generally been excluded from the factual findings because they cannot presently be corroborated to the same evidentiary standard.

Their exclusion reflects the investigative methodology employed in this report rather than a determination regarding their truth or significance.

8.8 Purpose of the Report

This report should not be interpreted as a final determination regarding the nature, origin, ownership, purpose, or cause of the observations documented herein.

Instead, it is intended to preserve evidence, identify recurring patterns, and provide investigators with a comprehensive record that may be compared against governmental

records, scientific data, aviation records, environmental monitoring, and other independently maintained sources.

The limitations described above should be considered alongside the strengths of the report, including the contemporaneous nature of the documentation, the preservation of original media and metadata, the extended duration of the investigation, and the use of publicly verifiable supporting records.
